Metalloproteinase Inhibitors

The present invention relates to therapeutically active hydroxamic acid and carboxylic acid derivatives, to processes for their preparation, to pharmaceutical compositions containing them, and to the use of such compounds in medicine. In particular, the compounds are inhibitors of metalloproteinases involved in tissue degradation.

Background to the Invention

Metalloproteinase Inhibitors

Compounds which have the property of inhibiting the action of metalloproteinases involved in connective tissue breakdown such as collagenase, stromelysin and gelatinase (known as "matrix metalloproteinases", and herein referred to as MMPs) are thought to be potentially useful for the treatment or prophylaxis of conditions involving such tissue breakdown, for example rheumatoid arthritis, osteoarthritis, osteopenias such as osteoporosis, periodontitis, gingivitis, corneal epidermal or gastric ulceration, and tumour metastasis, invasion and growth. MMP inhibitors are also of potential value in the treatment of neuroinflammatory disorders, including those involving myelin degradation, for example multiple sclerosis, as well as in the management of angiogenesis dependent diseases, which include arthritic conditions and solid tumour growth as well as psoriasis, proliferative retinopathies, neovascular glaucoma, ocular tumours, angiofibromas and hemangiomas.

Metalloproteinases are characterised by the presence in the structure of a zinc(II) ion at the active site. It is now known that there exists a range of metalloproteinase enzymes that includes fibroblast collagenase (Type 1), PMN-collagenase, 72 kDa-gelatinase, 92 kDa-gelatinase, stromelysin, stromelysin-2 and PUMP-1 (L.M. Matrisian, *Trends in Genetics*, 1990, 6, 121-125).

Many known MMP inhibitors are peptide derivatives, based on naturally occurring amino acids, and are analogues of the cleavage site in the collagen molecule. A recent paper by Chapman et al (J. Med. Chem. 1993, 36, 4293-4301) reports some

general structure/activity findings in a series of N-carboxyalkyl peptides. Other known MMP inhibitors are less peptidic in structure, and may more properly be viewed as pseudopeptides or peptide mimetics. Such compounds usually have a functional group capable of binding to the zinc (II) site in the MMP, and known classes include those in which the zinc binding group is a hydroxamic acid, carboxylic acid, sulphhydryl, and oxygenated phosphorus (eg phosphinic acid and phosphonic acid) groups.

Two known classes of pseudopeptide or peptide mimetic MMP inhibitors have a hydroxamic acid group and a carboxylic group respectively as their zinc binding groups. With a few exceptions, such known MMPs may be represented by the structural formula (IA)

in which X is the zinc binding hydroxamic acid (-CONHOH) or carboxylic acid (-COOH) group and the groups R₁ to R₅ are variable in accordance with the specific prior art disclosures of such compounds. The following patent publications disclose hydroxamic acid-based and/or carboxylic acid-based MMP inhibitors:

Brief Description of the Invention

The present invention makes available a new class of MMP inhibitors, related to those of general formula (I) known from the patent publications listed above in that they also have hydroxamic acid or carboxylic acid zinc binding groups, but incorporating a major structural change in the "backbone". In the compounds of this invention the portion of the "backbone" corresponding to the bracketed portion of general formula (I) may be represented by partial formula (IIA):

Specific compounds of the invention include those prepared according to the preparative examples below, in particular the following:

N-Hydroxy-2-[[2-(4-methoxy-phenoxy)-ethyl]-(toluene-4-sulfonyl)-amino]-acetamide,

N-Hydroxy-2-[(4-phenoxy-ethyl)-(toluene-4-sulfonyl)-amino]-acetamide,

N-Hydroxy-2-[(4-methoxy-benzenesulfonyl)-nonyl-amino]-acetamide,

2-[-Decyl-(toluene-4-sulfonyl)-amino]-N-hydroxyacetamide,

and salts, solvates or hydrates thereof.

Compounds according to the present invention in which X is a hydroxamic acid group (-CONHOH) may be prepared from compounds of the invention in which X is a carboxylic acid group (-COOH). That process, which forms another aspect of the invention, comprises:

- (a) causing an acid of general formula (IV)

or an activated derivative thereof to react with hydroxylamine, O-protected hydroxylamine, N,O-diprotected hydroxylamine, or a salt thereof, R_1 , R_2 , Y and Z being as defined in general formula (II) except that any substituents in R_1 , R_2 , Y and Z which are potentially reactive with hydroxylamine, O-protected hydroxylamine, N,O-diprotected hydroxylamine or their salts may themselves be protected from such reaction, then removing any protecting groups from the resultant hydroxamic acid moiety and from any protected substituents in R_1 , R_2 , Y and Z; or

- (b) deprotecting a diprotected hydroxamic acid derivative of formula (IVa)

in which R_1 , R_2 , Y and Z are as defined in general formula (II), R_{14} is an amino protecting group and R_{15} is a hydroxyl protecting group.

For method (a) conversion of (IV) to an activated intermediate such as the

pentafluorophenyl, hydroxysuccinyl, or hydroxybenzotriazolyl ester may be effected by reaction with the appropriate alcohol in the presence of a dehydrating agent such as dicyclohexyl dicarbodiimide (DCC), N,N-dimethylaminopropyl-N'-ethyl carbodiimide (EDC), or 2-ethoxy-1-ethoxycarbonyl-1,2-dihydroquinoline (EEDQ).

Protecting groups as referred to above are well known per se, for example from the techniques of peptide chemistry. Amino groups are often protectable by benzyloxycarbonyl, t-butoxycarbonyl or acetyl groups, or in the form of a phthalimido group. Hydroxy groups are often protectable as readily cleavable ethers such as the t-butyl or benzyl ether, or as readily cleavable esters such as the acetate. Carboxy groups are often protectable as readily cleavable esters, such as the t-butyl or benzyl ester.

Examples of O-protected hydroxylamines for use in method (a) above include O-benzylhydroxylamine, O-4-methoxybenzylhydroxylamine, O-trimethylsilylhydroxylamine, and O-tert-butoxycarbonylhydroxylamine.

Examples of O,N-diprotected hydroxylamines for use in method (a) above include N,O-bis(benzyl)hydroxylamine, N,O-bis(4-methoxybenzyl)hydroxylamine, N-tert-butoxycarbonyl-O-tert-butyltrimethylsilylhydroxylamine, N-tert-butoxycarbonyl-O-tetrahydropyranyhydroxylamine, and N,O-bis(tert-butoxycarbonyl)hydroxylamine.

For method (b) suitable protecting groups R_{14} and R_{15} are benzyl and substituted benzyl (eg 4-methoxybenzyl). Such protecting groups may be removed by hydrogenolysis, while the 4-methoxybenzyl group may also be removed by acid hydrolysis.

Compounds according to the present invention in which X is a carboxylic acid group -COOH may be prepared by a process comprising hydrolysis of a compound of formula (V):

wherein R_1 , R_2 , Y and Z are as defined in general formula (II), and R_{15} is a carboxy protecting group. Protected carboxy groups include readily cleavable esters, such as the tert-butyl or benzyl ester.

Compounds of formula (V) may be prepared by alkylation of the amino nitrogen of a sulfonamide of formula (VI) with an amine alkylating agent of formula (VII):

wherein R_1 , R_2 , and Z are as defined in general formula (II) except that any substituents in R_1 , R_2 , and Z, which are potentially reactive in the alkylation reaction may themselves be protected from such reaction, R_{15} is as defined for formula (V), and L is a leaving group. Leaving groups L for the alkylation of (VI) by (VII) are well known in the art and include halogen atoms (such as bromine) and triflate.

Sulfonamides of formula (VI) may be prepared by standard methods, including the reaction of an amine of formula (VIII) with an activated sulfonic acid of formula (IX):

wherein R_2 , and Z are as defined in general formula (II). Suitable activated derivatives of (IX) for condensation with (VIII) include the sulfonyl chloride.

As mentioned above, compounds of formula (II) are useful in human or veterinary medicine since they are active as inhibitors of MMPs.

Accordingly in another aspect, this invention concerns:

(i) a method of management (by which is meant treatment or prophylaxis) of diseases or conditions mediated by MMPs in mammals, in particular in humans, which method comprises administering to the mammal an effective amount of a compound as defined with respect to formula (II) above; and

(ii) a compound as defined with respect to formula (II) for use in human or

veterinary medicine, particularly in the management (by which is meant treatment or prophylaxis) of diseases or conditions mediated by MMPs; and

(iii) the use of a compound as defined with respect to formula (II) in the preparation of an agent for the management (by which is meant treatment or prophylaxis) of diseases or conditions mediated by MMPs.

Diseases or conditions mediated by MMPs include those involving tissue breakdown such as bone resorption, inflammatory diseases, dermatological conditions and tumour invasion by secondary metastases, in particular rheumatoid arthritis, osteoarthritis, periodontitis, gingivitis, corneal ulceration and tumour invasion by secondary metastases, tumour growth, tumour angiogenesis, multiple sclerosis, psoriasis, proliferative retinopathy, neovascular glaucoma, ocular tumour, angiofibroma and hemangioma.

In a further aspect of the invention there is provided a pharmaceutical or veterinary composition comprising a compound of formula (II) together with a pharmaceutically or veterinarily acceptable excipient or carrier.

One or more compounds of general formula (II) may be present in the composition together with one or more excipient or carrier.

The compounds with which the invention is concerned may be prepared for administration by any route consistent with their pharmacokinetic properties. The orally administrable compositions may be in the form of tablets, capsules, powders, granules, lozenges, liquid or gel preparations, such as oral, topical, or sterile parenteral solutions or suspensions. Tablets and capsules for oral administration may be in unit dose presentation form, and may contain conventional excipients such as binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, or polyvinyl-pyrrolidone; fillers for example lactose, sugar, maize-starch, calcium phosphate, sorbitol or glycine; tableting lubricant, for example magnesium stearate, talc, polyethylene glycol or silica; disintegrants for example potato starch, or acceptable wetting agents such as sodium lauryl sulphate. The tablets may be coated according to methods well known in normal pharmaceutical practice. Oral

liquid preparations may be in the form of, for example, aqueous or oily suspensions, solutions, emulsions, syrups or elixirs, or may be presented as a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, for example sorbitol, syrup, methyl cellulose, glucose syrup, gelatin hydrogenated edible fats; emulsifying agents, for example lecithin, sorbitan monooleate, or acacia; non-aqueous vehicles (which may include edible oils), for example almond oil, fractionated coconut oil, oily esters such as glycerine, propylene glycol, or ethyl alcohol; preservatives, for example methyl or propyl p-hydroxybenzoate or sorbic acid, and if desired conventional flavouring or colouring agents.

The dosage unit involved in oral administration may contain from about 1 to 250mg, preferably from about 25 to 250mg of a compound of the invention. A suitable daily dose for a mammal may vary widely depending on the condition of the patient. However, a dose of a compound of general formula I of about 0.1 to 300mg/kg body weight, particularly from about 1 to 100mg/kg body weight may be appropriate.

For topical application to the skin, the drug may be made up into a cream, lotion or ointment. Cream or ointment formulations which may be used for the drug are conventional formulations well known in the art, for example as described in standard textbooks of pharmaceuticals such as the British Pharmacopoeia.

For topical application to the eye, the drug may be made up into a solution or suspension in a suitable sterile aqueous or non aqueous vehicle. Additives, for instance buffers such as sodium metabisulphite or disodium edeate; preservatives including bactericidal and fungicidal agents such as phenyl mercuric acetate or nitrate, benzalkonium chloride or chlorhexidine, and thickening agents such as hypromellose may also be included.

The dosage for topical administration will of course depend on the size of the area being treated. For the eyes, each dose may typically be in the range from 10 to 100mg of the drug.

The active ingredient may also be administered parenterally in a sterile medium. Depending on the vehicle and concentration used, the drug can either be suspended or dissolved in the vehicle. Advantageously, adjuvants such as a local anaesthetic, preservative and buffering agents can be dissolved in the vehicle.

For use in the treatment of rheumatoid arthritis, the drug can be administered by the oral route or by injection intra-articularly into the affected joint. The daily dosage for a 70kg mammal may be in the range 10mgs to 1gram.

Preparative Example

N-Hydroxy-2-[octyl-(toluene-4-sulfonyl)amino]-acetamide

STEP A:

N-octyl-toluene-4-sulfonamide

A solution of toluene-4-sulfonyl chloride (5.0 g, 0.026 mol) in dry dichloromethane (150 ml) was cooled to 0°C during the dropwise addition of n-octylamine (9.6 ml, 0.058 mol) with stirring over 4 minutes. The reaction mixture was then allowed to stir for 30 minutes before being diluted with dichloromethane (200 ml) and water (200 ml). The organic layer was separated and washed consecutively with 1M HCl, 0.5 M Na₂CO₃ and brine before being dried over anhydrous Na₂SO₄. The solution was filtered and concentrated *in vacuo* to a crude solid which was purified by flash chromatography (silica gel, 11% ethyl acetate in hexane) to give the title compound as a white solid (7.0 g, 94%). This material was then used immediately in the next step.

STEP B:

[Octyl-(toluene-4-sulfonyl)amino]-acetic acid *tert*-butyl ester

N-Octyl-toluene-4-sulfonamide (7.0 g, 0.025 mol) was dissolved in dry THF (200

ml) and cooled to -78°C . A 1M solution of LHMDs in THF (27.2 ml, 0.028 mol) was then added over 10 minutes. The reaction mixture was allowed to warm to -40°C with stirring over 30 minutes. Neat *tert*-butyl bromoacetate (4.8 ml, 0.03 mol) was added over 5 minutes and the reaction mixture was allowed to warm to ambient temperature overnight. The reaction mixture was diluted with saturated aqueous NH_4Cl (200 ml) and ethyl acetate (200 ml). The organic layer was separated and washed consecutively with 1M HCl, 0.5M Na_2CO_3 and brine, dried over Na_2SO_4 , filtered and concentrated *in vacuo*. The resulting crude oil was purified by flash chromatography (silica gel, 6% ethyl acetate in hexane) to give the title compound as a white solid (5.2 g, 53%). ^1H NMR: δ (CDCl_3), 7.72 (2H, d, $J = 8.3$ Hz), 7.27 (2H, d, $J = 8.4$ Hz), 3.94 (2H, s), 3.23 (2H, dd, $J = 7.5, 7.6$ Hz), 2.42 (3H, s), 1.60 - 1.42 (2H, m), 1.39 (9H, s), 1.34 - 1.17 (10H, m), 0.88 (3H, t, $J = 6.9$ Hz).

STEP C:

[Octyl-(toluene-4-sulfonyl)amino]-acetic acid

An ice-cooled solution of [octyl-(toluene-4-sulfonyl)amino]-acetic acid *tert*-butyl ester (5.2 g, 0.013 mol) in dichloromethane (50 ml) was further diluted by the addition of 25% TFA in dichloromethane (200 ml). The reaction mixture was stored at 4°C overnight. Solvents were removed under reduced pressure and the residue was azeotroped with toluene. The resulting crude oil was purified by flash chromatography (silica gel, 10% methanol in dichloromethane) to give the title compound as a white solid (4.4 g, 99%). ^1H NMR: δ (CDCl_3), 9.77 (1H, br s), 7.71 (2H, d, $J = 8.3$ Hz), 7.25 (2H, d, $J = 8.2$ Hz), 4.00 (2H, br s), 3.19 (2H, dd, $J = 7.4, 7.7$ Hz), 2.38 (3H, s), 1.50 - 1.30 (2H, m), 1.30 - 1.05 (10H, m) and 0.85 (3H, t, $J = 6.6$ Hz).

STEP D:

N-Benzyloxy-2-[octyl-(toluene-4-sulfonyl)amino]-acetamide

[Octyl-(toluene-4-sulfonyl)amino]-acetic acid (4.0 g, 0.012 mol) was taken up in

DMF (150 ml) and treated at room temperature with NMM (1.55 ml, 0.014 mol) followed by EDC (2.92 g, 0.015 mol). The reaction mixture was allowed to stir for 15 minutes at room temperature before the addition of HOBt (2.1 g, 0.016 mol). The reaction mixture was left to stir for a further 20 minutes before a mixture of O-benzylhydroxylamine hydrochloride (1.87 g, 0.012 mol) and NMM (2.6 ml, 0.024 mol) in DMF (50 ml) was added. The reaction mixture was allowed to stir at room temperature for a further 48 h. The DMF was removed under reduced pressure and the resulting crude oil was dissolved in ethyl acetate (200 ml). The solution was washed consecutively with 1M HCl, 0.5M Na₂CO₃ and brine, dried over anhydrous Na₂SO₄, filtered and concentrated under reduced pressure. The resulting crude oil was purified by flash chromatography (silica gel, 10% methanol in dichloromethane) to give an oil which was further purified by flash chromatography (silica gel, 20% ethyl acetate in hexane) to give the title compound as a white solid (1.91 g, 37%). ¹H NMR: δ (CDCl₃), 9.39 (1H, br s), 7.65 (2H, d, J = 8.2 Hz), 7.45 - 7.20 (7H, m), 4.91 (2H, s), 3.67 (2H, br s), 3.07 (2H, dd, J = 7.5, 7.9 Hz), 2.40 (3H, s), 1.50 - 1.33 (2H, m), 1.31 - 1.10 (10H, m) and 0.86 (3H, t, J = 6.5 Hz).

Hydrogen gas was bubbled through the mixture for 2 hours at room temperature. The catalyst was removed by filtration and the solvent was removed under reduced pressure to give a crude solid which was purified by recrystallization from ethyl acetate/hexane (940 mg, 61%). m.p. 89 °C; ¹H-NMR; δ (CDCl₃), 7.69 (2H, d, J = 8.2 Hz), 7.32 (2H, d, J = 8.2 Hz), 3.76 (2H, s), 3.15 (1H, d, J = 7.6 Hz), 3.12 (1H, d, J = 7.9 Hz), 2.43 (3H, s), 1.58 - 1.41 (2H, m), 1.35 - 1.15 (10H, m) and 0.86 (3H, t, J = 6.4 Hz). ¹³C-NMR; δ (CDCl₃), 166.6, 144.2, 134.6, 129.9, 127.4, 50.7, 49.9, 31.6, 29.1, 29.0, 27.9, 26.6, 22.6, 21.5 and 14.0; IR (CDCl₃), ν_{\max} 3413, 2929, 2858, 1682, 1467, 1401, 1346, 1162 and 1091 cm⁻¹.
